?This book contains a collection of research papers on accounting information systems including their strategic role in decision processes, within and between companies. An accounting system is a complex system composed of a mix of strictly interrelated elements such as data, information, human resources, IT tool, accounting models and procedures. Accounting information systems are often considered the instrument by default for accounting automation. This book aims to sketch a clear picture of the current state of AIS research, including design, acceptance and reliance, value-added decision making, interorganizational links, and process improvements. The contributions in this volume emphasize that AIS has grown into a powerful strategic tool. The book provides evidence for this observation by examining a wide range of current issues ranging from theory development in AIS to practical applications of accounting information systems. In particular it focuses on themes of growing interest in the realm of XBRL and Financial Reporting, Management Information Systems, IT/IS Audit and IT/IS Compliance. The book will be of interest to financial and managerial accountants and IT/IS practitioners, including information systems managers and consultants.

Cost Accounting for Managerial Planning, Decision Making and Control emphasizes the analysis and evaluation of cost accounting information for managerial planning, control, and decision-making. Our goal is to help students (future managers) understand how cost accounting information adds value to an organization in a highly competitive business environment. The philosophy underlying the development of this book is that providing cost accounting information is primarily a logical process, rather than a procedural one. It is most important that students first understand the basic concepts and objectives, and then gain some experience in applying these concepts in different environments. Through this approach, students will be better equipped to deal with the unforeseen situations they will encounter in professional practice or on professional examinations. This philosophy is evident in each chapter, as basic concepts are presented and then illustrated with examples and a wide variety of homework problems. This text is intended for use in undergraduate and graduate courses in cost accounting at both the basic and advanced levels. It provides a complete and concise coverage of topics commonly included in a basic course, with an in-depth coverage of selected topics more appropriate for an advanced course in cost accounting. Modular coverage of these topics permits the instructor to adapt the text to his or her own preferences for course content. Plus, an extremely clear writing style contributes to the ease with which students will comprehend the contents of each chapter. By emphasizing the differing uses for cost accounting information, our intent is to make the student an intelligent provider, user, and interpreter of this information.

Organisations today are operating in an ever changing and more risky external business environment. To survive and grow in this environment it is now more important than ever that the information needs of the organisation are shaped by its goals and objectives and driven by its strategy choices. These strategy choices determine the processes and activities necessary to achieve the organisational objectives and goals. The resulting organisational outcomes contribute to the generation of owner wealth and increased organisational value and, in doing so, recognise the value adding potential of significant organisational relationships such as those with suppliers and customers. From a management accountant's perspective, these strategy choices define the design, function and operation of the organisation's management control systems and its underpinning performance management system. The focus of this book is on accounting for an organisation's external business environment and the associated risk implications for decision making and performance management. It is about accounting for operating strategies, processes and activities and the incorporation of risk into these strategic decisions and the management of performance. The tools, techniques and frameworks available to the management accountant are drawn from those used in traditional and contemporary management accounting, as well as those developed through a strategy-based value chain lens and a discussion on how strategy-based accounting might be achieved. "The authors carefully considered how to thoughtfully and meaningfully integrate data analytics into the financial accounting course, and are pleased to provide the following data analytics resources. Data Analytics and Decision-Making The text provides numerous discussions on how decision-makers are increasingly relying on data analytics to make decisions using accounting information. Accounting software systems collect vast amounts of data about a company's economic events as well as its suppliers and customers. Business decision-makers take advantage of this wealth of data by using data analytics to gain insights and therefore make more informed business decisions. As both data access and analytical software improve, the use of data analytics to support decisions is becoming increasingly common at virtually all types of companies"--
