Connecting the study of cognition to everyday life in an unprecedented way, E. Bruce Goldstein's COGNITIVE PSYCHOLOGY: CONNECTING MIND, RESEARCH, AND EVERYDAY EXPERIENCE gives equal treatment to both the landmark studies and the cutting-edge research that define this fascinating field. A wealth of concrete examples and illustrations help students understand the theories of cognition-driving home both the scientific importance of the theories and their relevance to students' daily lives. Goldstein's accessible narrative style blends with an art program that makes difficult concepts understandable. Students gain a true understanding of the "behind the scenes" activity that happens in the mind when humans do such seemingly simple activities as perceive, remember, or think. Goldstein also focuses on the behavioral and

physiological approaches to cognition by including physiological materials in every chapter. As is typical of his work, this fourth edition is a major revision that reflects the most current aspects of the field. Human Neuropsychology covers every major topic in the field, providing the perfect balance between theory and application, simultaneously introducing students to significant new developments in the area.

Dr. James W. Kalat's *BIOLOGICAL PSYCHOLOGY* is the most widely used text in the course area, and for good reason: an extremely high level of scholarship, clear and occasionally humorous writing style, and precise examples. Throughout all eleven editions, Kalat's goal has been to make biological psychology accessible to psychology students, not just to biology majors and pre-meds. Another goal has been to convey the excitement of the search for biological explanations of behavior, and Kalat delivers.

Updated with new topics, examples, and recent research findings--and supported by new online bio-labs, part of the strongest media package yet--this text speaks to today's students and instructors. Foundations of Biopsychology is an ideal companion for any biopsychology student and is particularly suitable for use on a semester-based course. This book is an introduction to how the brain produces behaviour. It does not assume any background knowledge in biology or psychology. Although academically rigorous, the text adopts an accessible, modular format and is supported throughout by diagrams and images.

Therapists have a unique opportunity and responsibility to provide a respectful environment for their clients, yet respect has not received adequate attention in the psychotherapy community and related research. *Respect-Focused Therapy: Honoring Clients Through the Therapeutic Relationship and Process* sets forth the formulation of respect-focused therapy (RFT), a new approach to psychotherapy that addresses the quality of the client–therapist relationship and therapeutic process. This volume treats respect as a combination of action, attitude and open-mindedness, urging therapists to recognize their own biases and beliefs and be willing to suspend them for the benefit of their clients. Using Martin Buber's "I-Thou" relationship as a conceptual model, Slay-Westbrook provides core principles of respect and demonstrates how to incorporate these into the therapeutic relationship to best foster a healing environment.

How do animals perceive the world, learn, remember, search for food or mates, communicate, and find their way around? Do any nonhuman animals count, imitate one another, use a language, or have a culture? What are the uses of cognition in nature and how might it have evolved? What is the current status of Darwin's claim that other species share the same "mental powers" as humans, but to different degrees? In this completely revised second edition of *Cognition, Evolution, and Behavior*, Sara Shettleworth addresses these questions, among others, by integrating findings from psychology, behavioral ecology, and ethology in a unique and wide-ranging synthesis of theory and research on animal cognition, in the broadest sense--from species-specific adaptations of vision in fish and associative learning in rats to discussions of theory of mind in chimpanzees, dogs, and ravens. She reviews the latest research on topics such as episodic memory, metacognition, and cooperation and other-regarding behavior in animals, as well as recent theories about what makes human cognition unique. In every part of this new edition, Shettleworth incorporates findings and theoretical approaches that have emerged since the first edition was published in 1998. The chapters are now organized into three sections: Fundamental Mechanisms (perception, learning, categorization, memory), Physical Cognition (space, time, number, physical causation), and Social Cognition (social knowledge, social learning, communication). Shettleworth has also added new chapters on evolution and the brain and on numerical cognition, and a new chapter on physical causation that integrates theories of instrumental behavior with discussions of foraging, planning, and tool using.

This market-leading text emphasizes future consumers of psychological research, uses real-world examples drawn from popular media, and develops students' critical-thinking skills as they become systematic interrogators of information in their everyday lives.

Biopsychology clearly presents the fundamentals of the study of the biology of behavior and makes the topics personally and socially relevant to the student. The defining feature of Biopsychology is its unique combination of biopsychological science and personal, reader-oriented discourse. It is a textbook that is "untextbooklike." Rather than introducing biopsychology in the usual textbook fashion, it interweaves the fundamentals of the field with clinical case studies, social issues, personal implications, and humorous anecdotes. It tries to be a friendly mentor that speaks directly to the reader, enthusiastically relating recent advances in biopsychological science.

Mark Costanzo and Daniel Krauss's text show students how psychological science can be used to reduce crime, improve legal decision making, and promote justice. Fully integrated discussions of real cases and trials, along with other examples of the legal system in action, show how research and theory can deepen our understanding of suspects, criminals, police, victims, lawyers, witnesses, judges, and jurors.

The advent of sensors capable of localizing portions of the brain involved in specific computations has provided significant insights into normal visual information processing and specific neurological conditions. This book brings together some of the strongest thinkers in this field, to explore cortical visual information processing and its underlying mechanisms.

What causes a child to grow up gay or straight? In this book, neuroscientist Simon LeVay summarizes a wealth of scientific evidence that points to one inescapable conclusion: Sexual orientation results primarily from an interaction between genes, sex hormones, and the cells of the developing body and brain. LeVay helped create this field in 1991 with a much-publicized study in *Science*, where he reported on a difference in the brain structure between gay and straight men. Since then, an entire scientific discipline has sprung up around the quest for a biological explanation of sexual orientation. In this book, LeVay provides a clear explanation of where the science stands today, taking the reader on a whirlwind tour of laboratories that specialize in genetics, endocrinology, neuroscience, cognitive psychology, evolutionary psychology, and family demographics. He describes, for instance, how researchers have manipulated the sex hormone levels of animals during development, causing them to mate preferentially with animals of their own gender. LeVay also reports on the prevalence of homosexual behavior among wild animals, ranging from Graylag geese to the Bonobo chimpanzee. In this revised edition LeVay broadens his horizons. He adds a new chapter on bisexuality, reviews some uncommon forms of sexuality such as asexuality and pedophilia, and considers whether there could be a biological basis for subtypes of gay people such as "butch" and "femme" lesbians. Although many details remain unresolved, the general conclusion is quite clear: A person's sexual orientation arises in large part from biological processes that are already underway before birth.
